PROJECT SUMMARY:

Running Water Road Drainage Improvements

The purpose of the Running Water Road Drainage Improvement Project is to improve drainage conditions for the existing residential development located along Running Water Road, as well as side street connections. This project consists of approximately 3,500 linear feet of new drainage infrastructure improvements along Running Water Road and on a county-owned ditch behind some of the residential lots located on the road.

Existing stormwater pipes will be replaced in the right-of-way, and the ditches and new pipes will provide positive drainage conveyance to the current existing outfall pond located at the far west end of Running Water Road. This project also includes modification to the pond’s existing weir.

Overall, the Running Water Road Drainage Improvement Project includes 54 new drainage structures, repaving of roads and driveways, fine grading of roadside ditches, and utility relocations. In addition, Georgetown County included the resurfacing of the entire road from the west end to the intersection of Journey’s End, for a total of 8,920 square yards. Also, Georgetown County has provided a budget for landscaping in the median along the new storm drain.

The county’s contractor has 150 days from Aug. 10, 2020, to substantially complete the entire project. At which time, an inspection meeting will occur to identify any deficiencies and the contractor will have 30 days to complete any identified deficiencies.
